

Invitation Strategy — brief

Concise plan for inviting Bali Girls creators to claim/complete their profiles via WhatsApp.

Goal

Get existing (pre-seeded) creators to sign in at <https://baligirls.gaiada2.online/creator>, check their profile, and add photos/details — by sending each one a warm, personal, **one-time** WhatsApp invitation.

Who sends

The OpenClaw agent **Charlie** (`.openclaw-chs` on `gda-ai01`), WhatsApp line **+62 817-6917-122**. Sends **directly over WhatsApp** — **no Twilio** (Twilio is only the site's login verification). **Fire-and-forget**: one message per creator, no two-way follow-up required.

What's sent — category-matched copy

Each creator gets the template matching their **DEMS category**. Templates live alongside this file:

Category	Template	Source rule
Dating	<code>dating.md</code>	<code>escort_type = 'dating'</code>
Escorts	<code>escorts.md</code>	<code>escort_type = 'escort'</code>
Message	<code>message.md</code>	<code>escort_type = 'message'</code>
Sugar	<code>sugar.md</code>	<code>escort_type = 'sugar babies'</code>
Trans	<code>trans.md</code>	<code>gender = 'trans'</code> (overrides <code>escort_type</code>)

Each template uses one merge field, `{{name}}` (← `providers.model_name`), and ends with the creator sign-in link.

Who receives — the contact list

`creator_contact.md` is the authoritative send list, generated from the app DB (`providers`). **214 invites** (escorts 154 · dating 29 · message 14 · sugar 11 · trans 6), overwhelmingly +62 Indonesia (192). It was built from 230 creators minus **16 profiles on 6 duplicate numbers**, which are excluded (listed in the file's Skipped section).

By country code (214 total)

Country	Invites
+62 Indonesia	192
+7 Russia/KZ	7
+44 UK	2

Country	Invites
+66 Thailand	2
+61 Australia	2
+373 Moldova	2
+86 China	1
+65 Singapore	1
+971 UAE	1
+972 Israel	1
+60 Malaysia	1
+33 France	1
+380 Ukraine	1

Send rules

1. For each row in `creator_contact.md`, send the template in its **Template** column with `{{name}}` replaced by **Name**.
2. **One message per number** — never message a number twice; never message a number not on the list.
3. Numbers are E.164 (+ + digits); sanity-check obviously malformed ones before sending.

What the creator experiences (after they tap the link)

The invite is just the front door. Sign-in itself is **passwordless** and verified by WhatsApp — no password to remember, no template, no app to install.

1. **Gets the invite** — a personal WhatsApp from Charlie (+62 817-6917-122) with the `.../creator` link.
2. **Taps the link** → the creator sign-in page. Enters their **WhatsApp number** (the same one we messaged). The system finds their pre-seeded profile by that number.
3. **Verifies by WhatsApp (user-initiated click-to-verify)** — the page shows a one-tap `wa.me` button pre-filled with a short code (`BG-...`) addressed to the site's **verification line +1 740 762 8065**. The creator taps it, WhatsApp opens with the message ready, and they hit **Send**.
4. **Auto-logged in** — the backend confirms by matching that inbound code from their number (it polls Twilio's Messages API), flips their account to `verified`, and signs them in. No code to type back.
5. **Lands on their profile** — they can now add photos and details. Their profile is live at their slug URL (e.g. `.../creator/preview/<slug>`).

Verification recap (the mechanics)

- **Passwordless** for users & creators: identify by WhatsApp number → verify by WhatsApp.
- **Primary path = user-initiated click-to-verify**: works **without** message templates or Meta business verification, using the free-form 24h window opened when the person messages first.

- **Twilio is used only here** (to read the inbound code via the Messages API) — **not** for the invitations. The SMS-OTP fallback exists but is **disabled** in the UI.
- ⚠️ Two different numbers, by design: creators are **invited** from Charlie's **+62 817-6917-122**, but they **verify by messaging +1 740 762 8065**. The invite copy points them to the website, not to a reply — so this is seamless, but keep it in mind for support.
- Full detail: [../verification/whatsapp-auth-lessons.md](#) (authoritative).

Status & risks

- ⌚ **Not live yet** — Charlie's WhatsApp line must be re-linked (QR scan) before any send; his on-host brain ([AGENTS.md](#)) still describes the old verifier role and must be rewritten for this invite job.
- ⚠️ **Ban risk** — bulk, unsolicited, business-initiated marketing over an unofficial WhatsApp Web client can get the number banned.
 - **Recommended throttle: max ~20 messages per day, sent ~1 hour apart, paced by OpenClaw** (Charlie self-schedules the drip — no manual blasting). At 20/day, the full 214-contact run takes ~11 days.
 - Also decide warm-up (start with a handful/day, ramp up) and an opt-out/stop handling rule.
